Magam's "HDSL" ladder, was developed internally by the company R&D team, upon the Israeli Special forces demand and according their strict standards. Today it's frequently used by some of Israel's official special forces and has an extensive track record of success.

The straps of the "HDSL" are made entirely from type-7 Nylon MIL-W-4008 that holds stress weight up to 2500 kg. The rungs are 30 cm width each are made of aluminum profiles 20 mm, covered with woven polyester to prevent slipping, and supported by straps. The rungs can hold a weight of up to 1000 kg each, and ladder in total holds safely up to 2000 Kg. The rungs and straps are reinforced with stitches equal in strength to the straps themselves. The ladder's upper and lower edges have hooks and D-Rings for building modular ladders and for anchoring the ladder. The ladder is available in varying lengths, according to customer demand and may be folded and carried in a compact case.

Suggested uses for the ladder include:

Emergency escape from high buildings, sliding down from a helicopter, climbing up on ships or oil rigs and more.

In Magam-Safety we are creating tailor made solutions for our clients, worldwide, in 80 years of operation. We will be happy to provide you with the exact solution you need.
